BXB™ (Bank Xtensible Billing™)

Large multinational corporations want to streamline their banking practices. In order to do this, they need all of their bank billing electronically, and in a common format.

BXB™ is a complete system devoted to generation and archiving of electronic billing statements in both the TWIST BSB format and the ANSI 822 format. Both of these formats require a sophisticated system to accept the bank data, respond to endpoint delivery options, generate the electronic statements across customer relationships, and archive them for initial delivery and possible redelivery.

BXB™ is a multi-bank system; it manages any number of banks, or bank branches, each with differing characteristics and billing systems. BXB Statement Review allows the authorized user to examine and update any or all of the statement sections, both before and after initial delivery. These sections are:

- Balances
- Rate Information
- Service
- Adjustments
- Tax Information

The primary source of statement information is the bank's billing system(s). On a monthly basis the billing system(s) forward balance, service, pricing and tax information to BXB by means of the Analysis Download File (ADF). The ADF is a flat text file using pre-defined transaction formats. The ADF file can also be used to forward account demographic and relationship information.

System Design

The basic BXB™ maintenance and processing functions are contained in a client server environment but presented in a Web format.

Call us now to see how the BXB™ system will revolutionize your commercial billing.
